Kaikeel Handbook Lite: Release Checklist
(Fictional sample document for the DocQA demo.)

VERSIONING
Every release gets a semantic version number: MAJOR.MINOR.PATCH.
Increase PATCH for bug fixes, MINOR for backwards-compatible features,
and MAJOR for breaking changes. The first client release is 0.1.0.

CHANGELOG
Move the entries under Unreleased into a new section named after the version,
with the release date. Group entries as Added, Changed, Fixed and Removed.

TAGGING
Create an annotated git tag such as v0.1.0 on the merge commit in main.
The handover zip archive is always built from the tag, never from a branch.

GATES BEFORE TAGGING
The quality report and the security report must both say PASS.
CI must be green on the exact commit that will be tagged.

ROLLBACK PLAN
Every release note states how to roll back: which previous tag to redeploy and whether any database migration must be reverted first.
A rollback drill is rehearsed once per quarter on a staging copy.

ANNOUNCEMENT
After tagging, the delivery lead posts a short release note to the client thread listing the version, the highlights and any action the client must take.
